## Step 2: Effective Screening

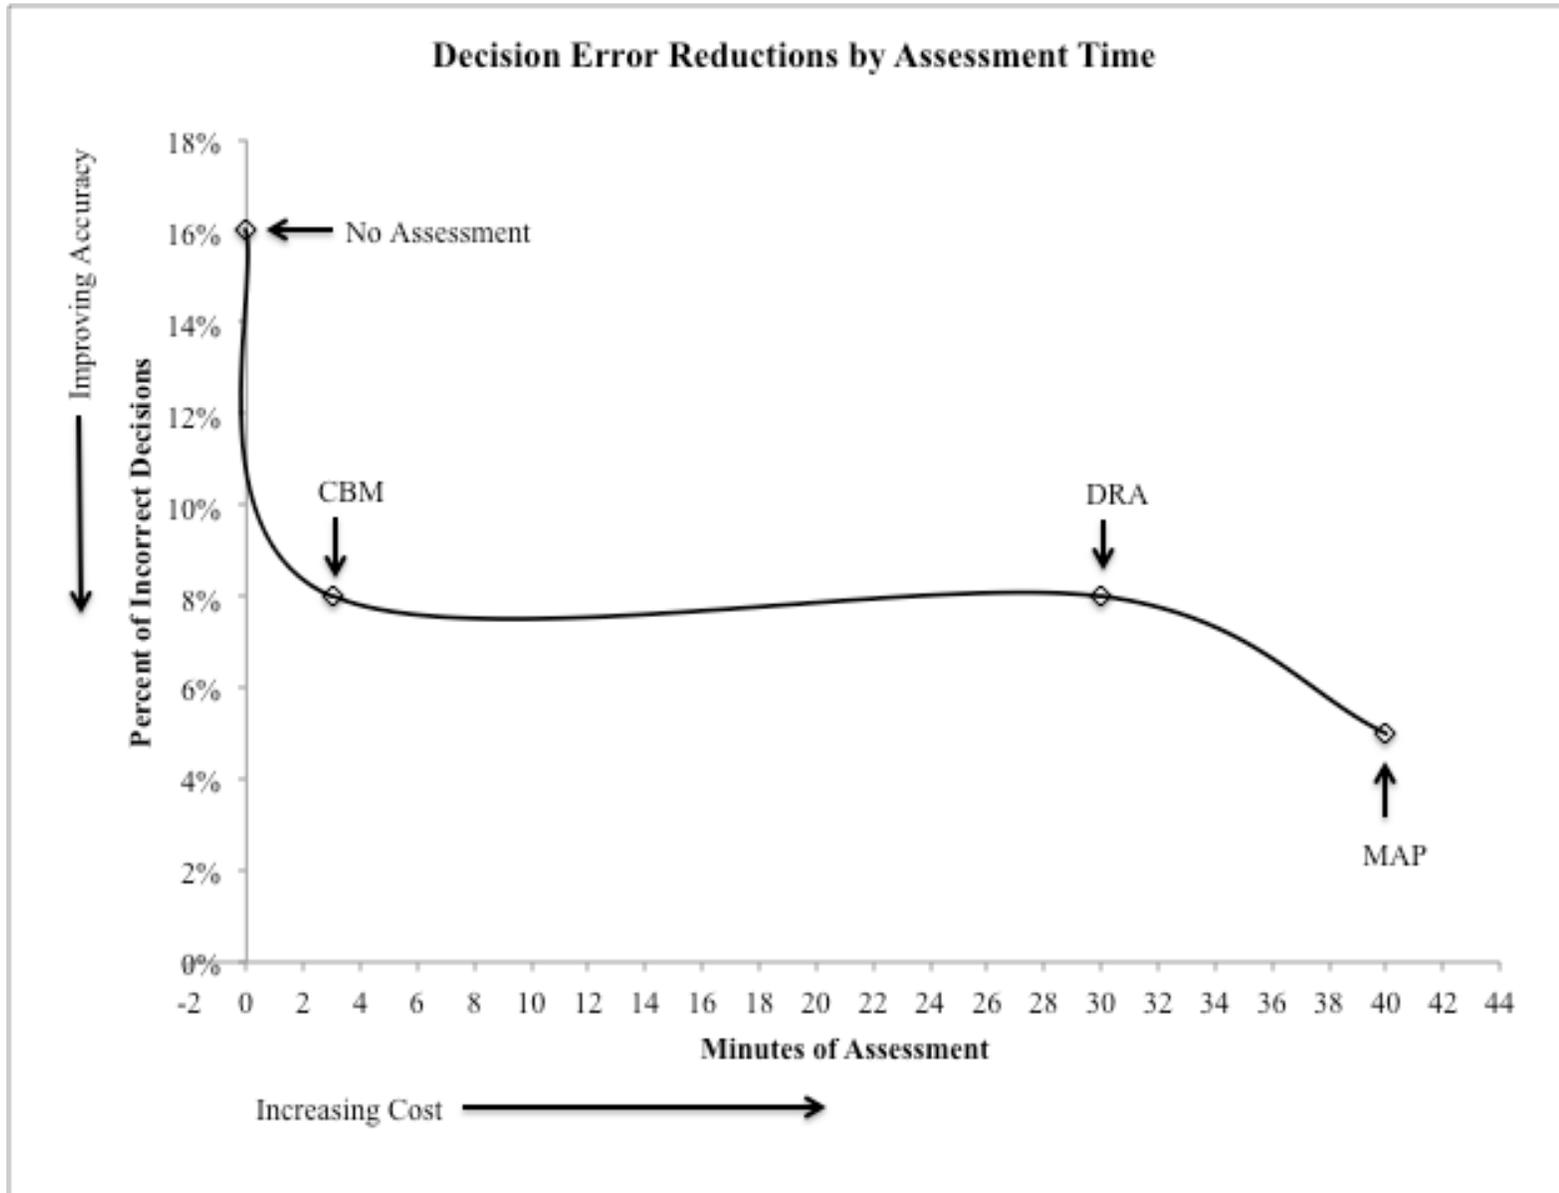

Concurrent  
Correlated  
Measures Do Not  
Increase Accuracy  
of Risk Decision

---

Avoid Over-Assessment

# All Assessments Come at a Cost

Avoid Over-Assessment

# In Math Screening Specifically

The preceding year-end test score is not bad to determine fall risk status

Single-skill computation measures work very well

Single-skill computation probes tend to be more sensitive than other measures.

But teachers tend to like measures that look like their instruction (reflect the full breadth of their instructional objectives)

Intervention trials make screening more accurate (because changes the base rate or prevalence of failure).

# Big Ideas in Math Assessment

	Grades									
	K	1	2	3	4	5	6	7	8	
Combining Rational Numbers and Variables	Blue									
Taking Rational Numbers and Variables	Green									
Quantity Comparison, Ordinal Position, Place Value	Red									
Multiplicative Reasoning	Orange									
Proportional Reasoning	Tan									
Solving for Unknowns	Teal									
Creating Equivalent Quantities	Purple									

	Screening Fall	Screening Winter	Screening Spring
<b>Kindergarten</b>	<ul style="list-style-type: none"> <li>Counting Objects to 10, Circle Answer</li> <li>Identify Number, Draw Circles to 10</li> <li>Quantity Comparison with Dots to 10</li> <li>Missing Number 0-10</li> </ul>	<ul style="list-style-type: none"> <li>Count Objects, Write Number to 20</li> <li>Identify Number, Draw Circles</li> <li>Quantity Comparison with Dots to 20</li> <li>Missing Number 0-20</li> </ul>	<ul style="list-style-type: none"> <li>Change Quantity with Dots to 10</li> <li>Missing Number 0-20</li> <li>Sums to 5 Kinder</li> <li>Subtraction 0-5 Kinder</li> </ul>

## Count Objects 1-20, Circle Answer

Date: 11/10/2016 (version: e210)

Say, "Let's do the first problem together. How many dots do we have? Let's count and see. [Count the dots in the first problem]. How many? That's right, we have [say number] of dots. Your job is to find that number over here and circle that number. When I tell you to begin, try to work as many as you can before the time is up. Be sure to count silently, inside your head." Set timer for one minute. Say, "Ready? Begin." After the timer sounds, say, "Stop. Hold your paper up in the air so I can pick it up."

## Place Fractions on Number Line (denominators: 1,2,3,4,5,6,8,10)

Date: 11/10/2016 (version: d985)

For these problems, you will locate and mark the fraction quantity on the number line. This number line begins at 0 and ends at 3. Mark the quantity with a dot. Let's do the first one together." Work the first problem to verify student understanding. "When I say begin, start with the second problem on the first row and work across. Don't skip any problems. Work as many problems as you can before the time is up. Do you have any questions?" Set timer for 2 minutes, start timer, and say, "Begin." Stop student after 2 minutes and count up problems correct.

$2\frac{4}{6}$ 	$\frac{2}{3}$ 	$1\frac{4}{5}$ 	( )/3

### Intervention Protocol

Classwide Fact Families: Add/Subtract 0-9

Student:

Grade: 01

Teacher: Paul Muyskens

Class name: 1 Mathematics (-Hayden-)

Date: 1/22/2019

### Classwide Math Intervention

#### Preparation:

- This is your master set of materials for the week.
- Make 1.5 copies of the practice sheets Day 1-5 for each student in your class (ex. if you have 20 students make 30 copies). Each student will have one copy for independent practice, while each pair of students will have one copy for paired practice.
- If you are using flashcards to practice, you can make only 1 copy per student.
- To set up your student pairs click on "Students" in your dashboard, then "Suggested Student Pairs."
- Identify the first "Worker," which should be the higher-performing student. This student will always work first.

- Say, **It's time for Spring Math. Please get together with your math partner. Please take out your practice materials, have your colored pen and pencil out, and show me you are ready.**
- Say, **Workers, your job is to work as many problems correctly as you can. As you work, be sure to talk through the problem so your partner can HEAR and SEE you solve the problem. Use a quiet voice while you work.**
- Say, **Helpers, your job is to follow along, listen and watch as the worker is working problems. If you see an error, speak up! Say, "Stop, Let's check this one."**

You should give the worker a hint, point to the exact error, but don't give them the answer. See if the worker can fix the error.

If the worker is stuck, give the answer but solve it aloud so the worker knows how you got that answer. If you get really stuck, circle the problem and ask me for help.

- Set the timer for 3 minutes.
- Say, **Remember, your goal is to work as many problems as possible with 100% accuracy. Ready? Begin!** Start the timer when you say Begin.

# Active Ingredients

- Modeling
- Practice for the right level of difficulty (opps to respond, complete learning trials)
- Corrective feedback & repetition loop
- Goal setting
- Delayed error correction w verbal rehearsal component
- Reward
- Advances difficulty based on proficiency

# The Instructional Hierarchy

# Use Data to Drive Individual Intervention

**Day 1**

**Acquisition Convert Improper Fractions to Mixed Numbers**

Student: \_\_\_\_\_

**When we convert improper fractions to mixed numbers, we will take a whole number quantity out of the fraction. When we do this, the numerator will be less than the denominator because the remaining fractional value will be less than 1.**

**To convert the improper fraction to a mixed number, we:**

**Divide the numerator by the denominator, asking how many times the denominator can be divided into the numerator, and identify any remainder**

**Write the remainder as the new numerator**

**Copy the denominator from the original fraction.**

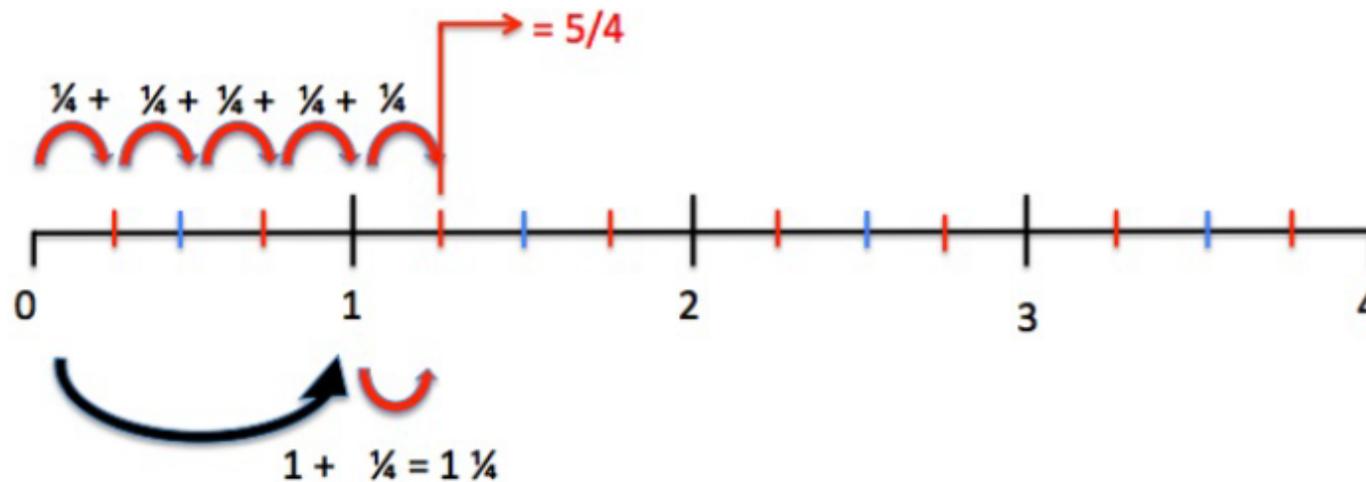

Work Problem	Check Answer	Match?	Work Problem	Check Answer	Match?
$\frac{75}{7} =$	$\frac{75}{7} = 10\frac{5}{7}$		$\frac{95}{9} =$	$\frac{95}{9} = 10\frac{5}{9}$	
$\frac{25}{4} =$	$\frac{25}{4} = 6\frac{1}{4}$		$\frac{109}{10} =$	$\frac{109}{10} = 10\frac{9}{10}$	
$\frac{35}{4} =$	$\frac{35}{4} = 8\frac{3}{4}$		$\frac{13}{3} =$	$\frac{13}{3} = 4\frac{1}{3}$	

## Build Conceptual Understanding

Complete several of these each day with the child, encouraging the child to solve each problem aloud:

**Play War:** Make 20 cards with mixed numbers (2 copies of each for a total of 40 playing cards). Each player turns over a card and the player with the greater quantity wins both cards. If the values are tied, then each player places three cards face-down and turns over the fourth card. The player with the higher value card to all the cards. The object of the game is to win all the cards.

Using the day's practice problems, have the student draw each mixed number on a number line. Several number lines are provided below the sample problem. Help the student choose the best one.

This one shows  $\frac{1}{4}$  units.

This one shows  $\frac{1}{3}$  units.

$$\frac{55}{7} = \frac{7}{7} \times \frac{\quad}{\quad} = \frac{49}{7}$$

This one is not enough.  
How much more is needed?

$$\frac{7}{7} \times \frac{7}{7} + \frac{\quad}{7} = \frac{55}{7}$$

$$\frac{7}{7} \times \frac{8}{7} - \frac{\quad}{7} = \frac{55}{7}$$

This one is too much.  
How much too much is this one?

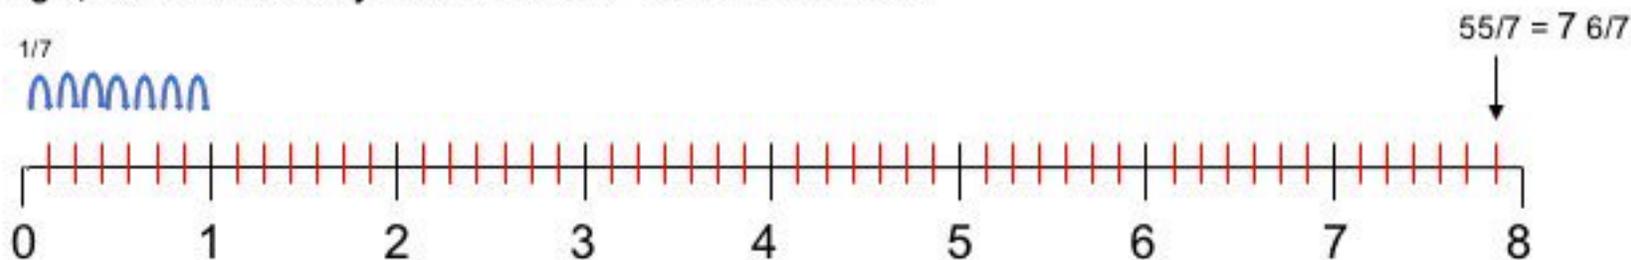

Answer will be between these two factors

Let's find the answer on a number line. We can ask, **How many  $1/7$  units are in  $55/7$ .** There are 7,  $1/7$ th units in each increment of 1. **Let's count and check ( $1/7 + 1/7 + 1/7 + 1/7 + 1/7 + 1/7 + 1/7 = 7/7$  or 1).**

**So we want to multiply  $7 \times (7/7)$  which gives us  $49/7$ . How many more  $1/7$ th units do we need to get to 55? That's right, 6 more  $1/7$ th units will get us to  $55/7$  or  $55 \ 1/7$ th units. We can count and check if we want.**

**Can you see another way to get to  $55/7$  that's easier and faster to find on the number line (hint, look above)?**

**Right,  $8 \times 7/7$  is  $56/7$  so just one more  $1/7$ th unit than we need.**

Let's practice converting whole numbers into fraction base unit quantities. We've just learned how to convert 7 into  $\frac{1}{7}$  units. We multiplied  $7/1 \times 7/7$  to get  $49/7$ . This makes sense because we know,  $49 \div 7 = 7$ .

Let's try some more. Write the equation and then solve.

Change 5 into  $\frac{1}{4}$  units: \_\_\_\_\_ x \_\_\_\_\_ = \_\_\_\_\_

Change 3 into  $\frac{1}{6}$  units: \_\_\_\_\_ x \_\_\_\_\_ = \_\_\_\_\_

Change 4 into  $\frac{1}{8}$  units: \_\_\_\_\_ x \_\_\_\_\_ = \_\_\_\_\_

Change 2 into  $\frac{1}{10}$  units: \_\_\_\_\_ x \_\_\_\_\_ = \_\_\_\_\_

Change 8 into  $\frac{1}{5}$  units: \_\_\_\_\_ x \_\_\_\_\_ = \_\_\_\_\_

Change 3 into  $\frac{1}{7}$  units: \_\_\_\_\_ x \_\_\_\_\_ = \_\_\_\_\_

Let's think more about improper fraction quantities. A few moments ago, we looked at  $55/7$  on the number line. We can see that  $55/7$  is between 7 and 8 on the number line.  $55/7$  is more than 7 but less than 8. Let's complete the following statements to make them true. There are several answers that can be correct for these questions, but for today, I want you to choose the closest whole number on either side of the improper fraction quantity. If you want, you can draw a number line next to each statement to prove your conclusion.

$10/8$  is more than \_\_\_\_\_ but less than \_\_\_\_\_.

Copyright 2019 Dr. Amanda M. VanDerHeyden. All rights reserved.

---

$14/5$  is more than \_\_\_\_\_ but less than \_\_\_\_\_.

$10/3$  is more than \_\_\_\_\_ but less than \_\_\_\_\_.

$17/5$  is more than \_\_\_\_\_ but less than \_\_\_\_\_.

$19/4$  is more than \_\_\_\_\_ but less than \_\_\_\_\_.

$26/5$  is more than \_\_\_\_\_ but less than \_\_\_\_\_.

Fill in the missing number to solve. Try to solve these by thinking of each quantity on a number line.

$$44/9 + \underline{\hspace{2cm}} = 5$$

$$14/5 + \underline{\hspace{2cm}} = 3$$

$$19/5 + \underline{\hspace{2cm}} = 4$$

$$9/5 + \underline{\hspace{2cm}} = 2$$

$$13/7 + \underline{\hspace{2cm}} = 2$$

$$10/8 - \underline{\hspace{2cm}} = 1$$

$$14/3 - \underline{\hspace{2cm}} = 4$$

$$16/5 - \underline{\hspace{2cm}} = 3$$

**Why is the numerator larger than the denominator when a mixed number is converted to a fraction? Is the numerator always greater than the denominator when a mixed number is converted to a fraction?**

**Can the numerator ever be greater than the denominator if the fraction is in its simplest form?**

**Using problems from the day's practice materials, ask the student to check to see that an improper fraction was correctly converted to a mixed number by asking the student to convert the improper fraction back to a mixed number.**

**Ask, Why is it useful to convert an improper fraction to a mixed number? (Hint: easier to understand quantity).**

What Active Ingredients Do  
You See?

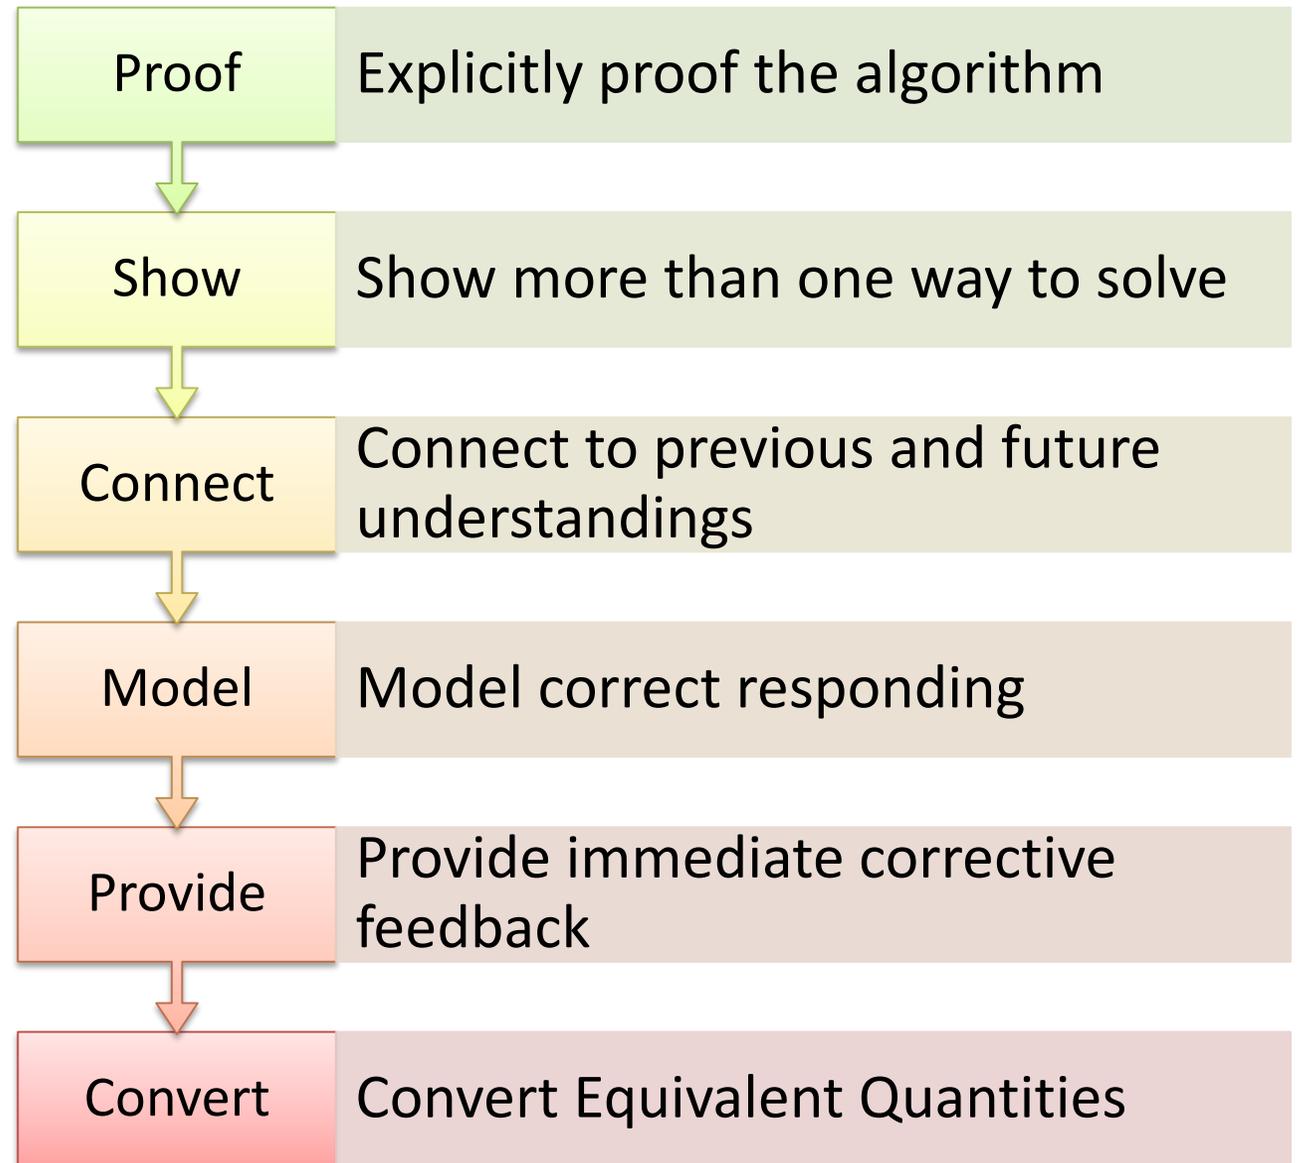

---

What Active Ingredients Do  
You See?

---

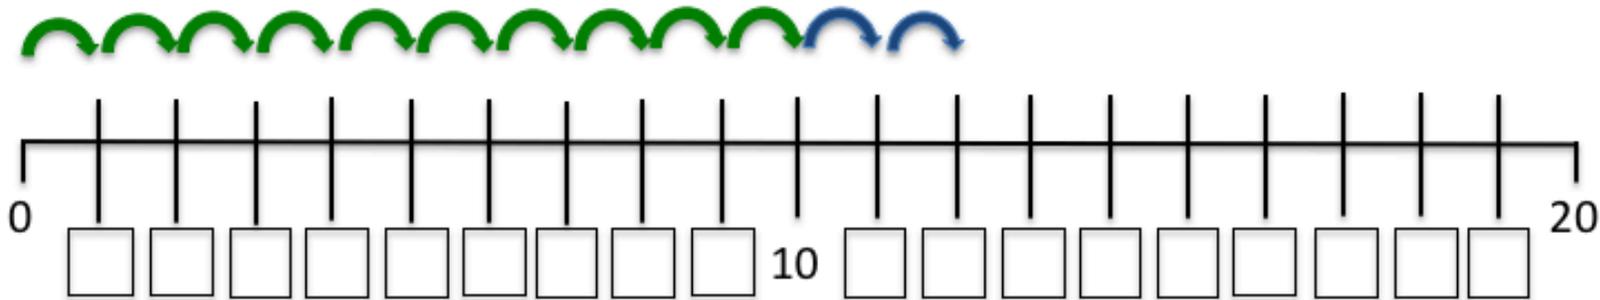

# Look for Interventions that

Show the child a number line and say, **Let's find  $10 + 2$ .** Say, **This number line goes from zero to 20. Ten is here** (point to the 10). **Let's count how many copies of "1" 10 is.** Guide the child to count the units to 10. Show the child that 10 can be written as  $1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1$ . **Let's fill in the boxes for the units on the number line.** Guide the child to fill in the missing number for each unlabeled unit on the number line.

**Can you find another way to write 10?** If the child cannot answer, prompt, **Here is the 5. How many must we add to 5 to get 10? Let's count and check. Can you find another way?**

**Now let's solve  $10 + 2$ . Let's find the 10 on the number line. If we count up 2 units from 10, what is the sum?** Show the child how to count from zero to 12. Then show the child how to start with 10 and count up 2 units.

Explicitly prove the algorithm

# Show More than One Way to Solve

Let's find the "doubles" inside these problems.

$$6 = \underline{\quad} + \underline{\quad}$$

$$8 = \underline{\quad} + \underline{\quad}$$

$$12 = \underline{\quad} + \underline{\quad}$$

$$16 = \underline{\quad} + \underline{\quad}$$

$$20 = \underline{\quad} + \underline{\quad}$$

Now we are warmed up. Fill in the blanks for each problem below. You must include a double.

$$5 = 2 + \underline{\quad} + \underline{\quad}$$

$$9 = 4 + \underline{\quad} + \underline{\quad}$$

$$17 = 8 + \underline{\quad} + \underline{\quad}$$

$$3 = 1 + \underline{\quad} + \underline{\quad}$$

$$7 = 3 + \underline{\quad} + \underline{\quad}$$

$$11 = 5 + \underline{\quad} + \underline{\quad}$$

$$15 = 1 + \underline{\quad} + \underline{\quad}$$

$$19 = 3 + \underline{\quad} + \underline{\quad}$$

$$19 = 1 + \underline{\quad} + \underline{\quad}$$

Now let's find 10's inside these problems to find the sums. Fill in the missing number and remember, you must make a 10.

---

$$12 = \underline{\quad} + \underline{\quad}$$

$$14 = \underline{\quad} + \underline{\quad}$$

$$13 = \underline{\quad} + \underline{\quad}$$

$$8 + 8 + 2 = 10 + \underline{\quad}$$

$$5 + 5 + 8 = 10 + \underline{\quad}$$

$$4 + 4 + 6 = 10 + \underline{\quad}$$

$$13 + 3 = \underline{\quad} + \underline{\quad} + \underline{\quad}$$

$$14 + 4 = \underline{\quad} + \underline{\quad} + \underline{\quad}$$

Start with a set of counters. Say, **We are going to add objects. Here are 20** (count out 20). **Let's make 20 twenty different ways.** Guide the child to divide the counters into two sets of quantities (e.g.,  $10 + 10$ ,  $19 + 1$ ,  $15 + 5$ ) and count to find 20.

Combine the full set of 20 counters into a single set. Pull out 1 counter and ask the child to see how many we must add to 1 counter to equal 20. After the child responds correctly, remove 10 counters and ask the child to see how many we must add to the set of 10 to equal 20. Do the same for numbers 11-19 in random order.

Use the problems from the day's practice sheet and say, **Draw two ways to solve this problem.** Guide the child to write as hashmarks, to solve on a number line, or to write as an equivalent equation.

Show the child a number line and say, **Let's find  $10 + 2$ .** Say, **This number line goes from zero to 20. Ten is here** (point to the 10). **Let's count how many copies of "1" 10 is.** Guide the child to count the units to 10. Show the child that 10 can be written as  $1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1$ . **Let's fill in the boxes for the units on the number line.** Guide the child to fill in the missing number for each unlabeled unit on the number line.

**Can you find another way to write 10?** If the child cannot answer, prompt, **Here is the 5. How many must we add to 5 to get 10? Let's count and check. Can you find another way?**

# Connection to Previous Understanding

---

Now let's find 10's inside these problems to find the sums. Fill in the missing number and remember, you must make a 10.

---

$$12 = \underline{\quad} + \underline{\quad}$$

$$14 = \underline{\quad} + \underline{\quad}$$

$$13 = \underline{\quad} + \underline{\quad}$$

$$8 + 8 + 2 = 10 + \underline{\quad}$$

$$5 + 5 + 8 = 10 + \underline{\quad}$$

$$4 + 4 + 6 = 10 + \underline{\quad}$$

$$13 + 3 = \underline{\quad} + \underline{\quad} + \underline{\quad}$$

$$14 + 4 = \underline{\quad} + \underline{\quad} + \underline{\quad}$$

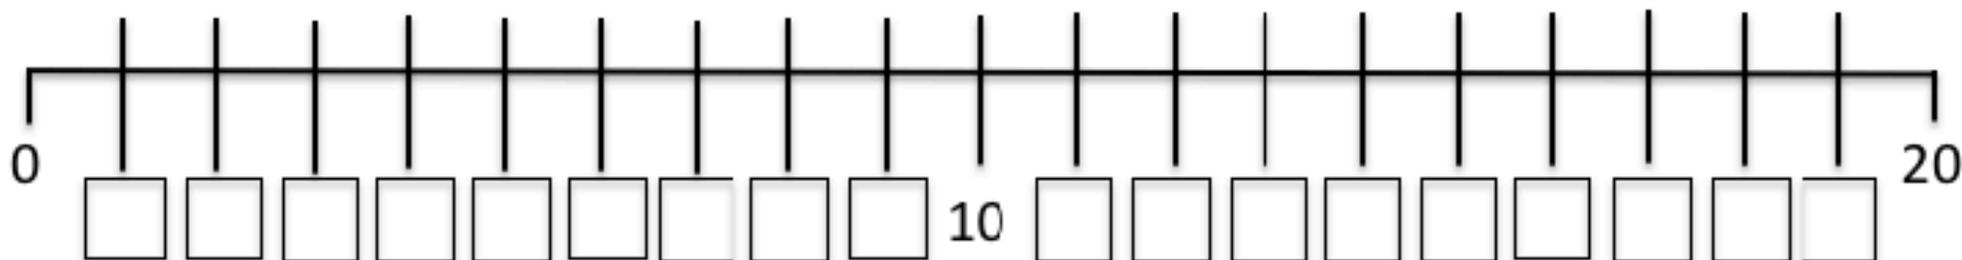

# Connection to Future Understanding

---

Say, **Show me three ways to make 15.** Help the child show that 15 can be represented as  $1 + 14$ ,  $15 + 0$ ,  $7 + 8$ ,  $10 + 5$ , adding 1's only,

---

and so on. Use the number lines below to find the answers as needed.

# Convert Quantities

---

- Say, **We are going to practice adding numbers. Let's do the first one together. What number is this?**

Draw hash marks next to the top number in the problem and say the number name aloud.

Then say, **That's right. What number is this?** while pointing to the bottom number. Draw that number of hash marks for the child.

Say, **Let's add the numbers together.** Guide the child to count the hash marks aloud then say, **Write the answer here** (point to box).

Slide down the card covering the answer column to show the correct answer and ask the child, **Is the number the same? Yes, you got it right!**

Show the child how to make a check mark in the box for a correct match.

Once the child can independently draw and count hash marks, show the child how to identify the larger number and count up from that number to get the answer (so given  $3 + 2$ , the child will say "3" and then count up two places using his or her fingers if needed saying aloud "4, 5" to get the answer).

Some children may start counting up from 1 regardless of the size of the first number and there is no need to interrupt their use of this strategy.

Once the child is responding accurately and confidently, simply show the child that he or she can start with the larger number in his head and begin counting up from that number.

# Explicit Modeling

---

- Ensure that the child answers each problem correctly. Ensure that the child writes the number in the box without peeking at the answer box. Ensure that the child lifts the cover to check his or her answer.
- Ensure that the child makes a check mark in the “Match” box for correct answers.
- If there is not a match (the child's response was incorrect), guide the student to count again and assist as needed to ensure correct counting/adding.

### Troubleshoot

Children should be able to fluently read numbers, be able to count fluently from 1-20, be able to count sets of objects and specify the number of objects, and understand that counting up from 0 to 20 indicates greater quantities to benefit maximally from this intervention.

Once the child can fluently draw and count both sets of hash marks to obtain the sum, guide the child to identify the larger number and count up.

If the child cannot readily identify the larger number, have the child circle the larger number in the problems on the practice page.

If the child continues to struggle to identify the greater number in the set, then consider adding the “Establish Quantity Discrimination” intervention to this intervention.

The purpose of timing the intervention period is to contain the intervention to a focused and productive 10-minute period.

This intervention requires direct assistance from the teacher. The teacher should sit beside the child and actively monitor each response to ensure the student is completing each problem accurately.

If a mistake is made, the teacher should guide the student to “try again” and provide prompts as needed to ensure correct responding.

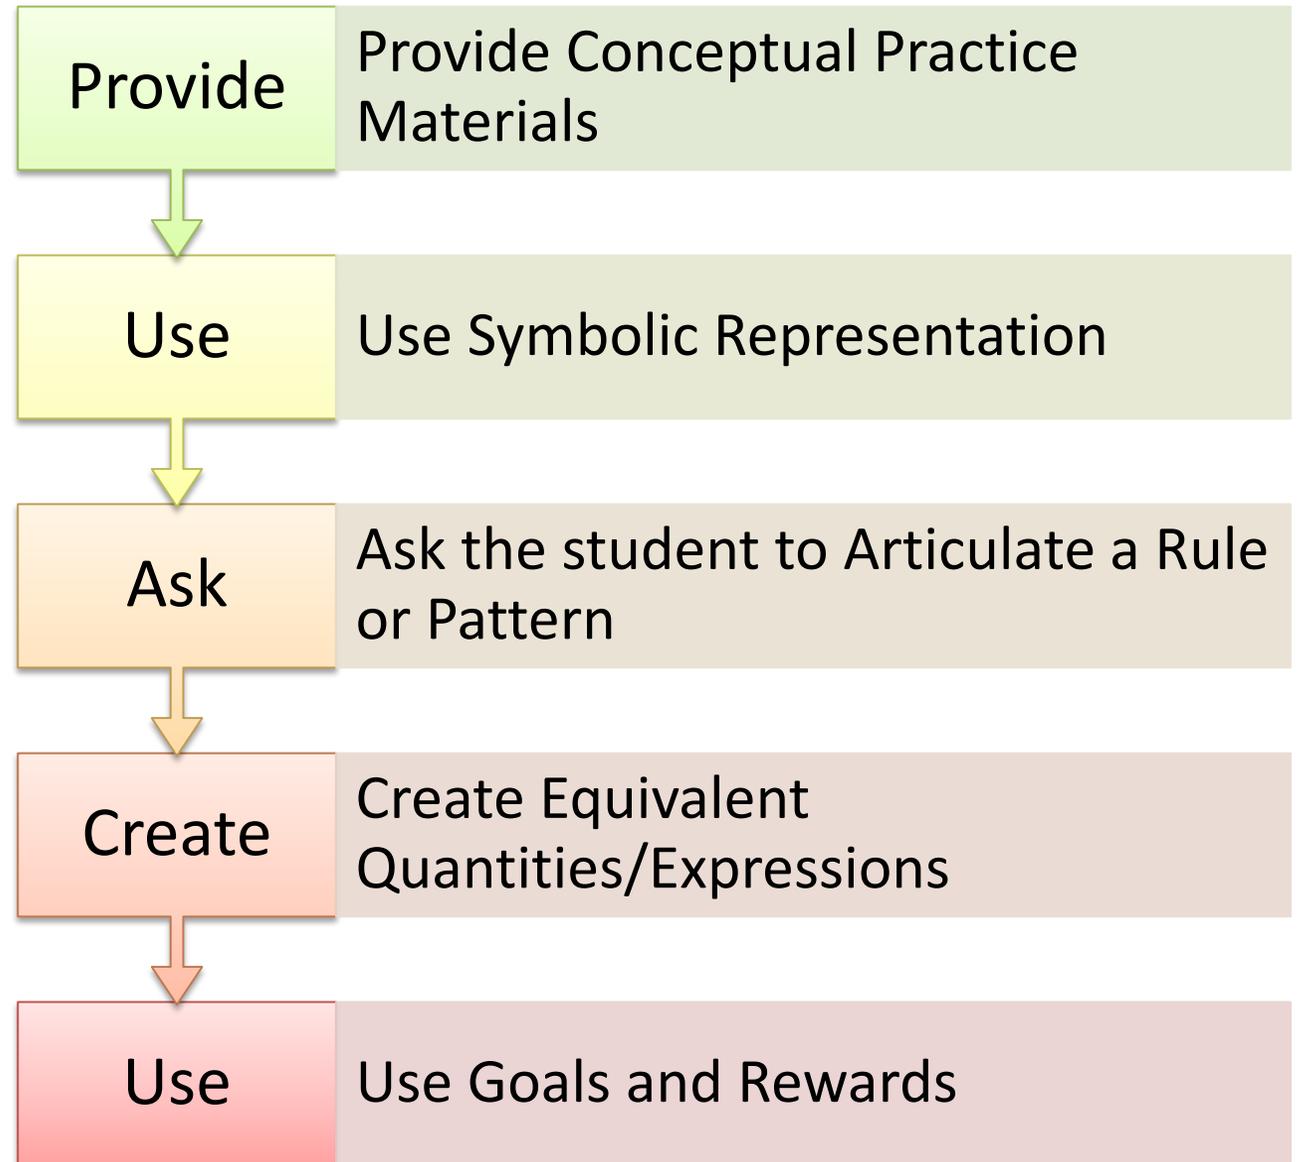

For example, the teacher might say, **Stop.  $12 + 7$  does not equal 18, let's try again.**

If the child does not respond correctly, the teacher might say, **Which number is larger? 12, that's right. So let's count seven up from 12.**

If the child does not respond correctly the teacher might model, saying, “12” then holding one finger up at a time, **13, 14, 15, 16, 17, 18, 19. So what is  $12 + 7$ ? 19, that's right. Let's do the next one.**

# Immediate Corrective Feedback

# Look for Interventions that

Day 1  
Acquisition Sums to 20

Student: \_\_\_\_\_

Work Problem	Check Answer	Match?	Work Problem	Check Answer	Match?
$\begin{array}{r} 14 \\ + 3 \\ \hline \end{array}$	$\begin{array}{r} 14 \\ + 3 \\ \hline 17 \end{array}$		$\begin{array}{r} 3 \\ + 1 \\ \hline \end{array}$	$\begin{array}{r} 3 \\ + 1 \\ \hline 4 \end{array}$	
$\begin{array}{r} 15 \\ + 0 \\ \hline \end{array}$	$\begin{array}{r} 15 \\ + 0 \\ \hline 15 \end{array}$		$\begin{array}{r} 1 \\ + 17 \\ \hline \end{array}$	$\begin{array}{r} 1 \\ + 17 \\ \hline 18 \end{array}$	
$\begin{array}{r} 16 \\ + 0 \\ \hline \end{array}$	$\begin{array}{r} 16 \\ + 0 \\ \hline 16 \end{array}$		$\begin{array}{r} 19 \\ + 0 \\ \hline \end{array}$	$\begin{array}{r} 19 \\ + 0 \\ \hline 19 \end{array}$	

# Symbolic Representation

---

Ask the child, **When we add two numbers that are greater than zero, will the answer be greater than or less than this number**(point to the top number)?

**Will the answer be greater than or less than this number**(point to the bottom number)?

**When we add zero to another number, what will the answer be? Can you explain why?**

**Write an addition problem with a sum of 10, using the greatest number of addends possible**(Answer:  $1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1 + 1$ ).

**Write an addition problem with a sum of 10, using the greatest number possible as one of the two numbers you are adding**(Answer  $10 + 0$ )

**Find two doubles in the problem  $6 + 1$**  (Answer:  $2 + 2 + 3$  and  $3 + 3 + 1$ ).

**Write an addition problem to show 10, using only the number 2.**

# Asks Student to Articulate Rule or Pattern

# Create Equivalent Quantities

Let's find the "doubles" inside these problems.

$$6 = \underline{\quad} + \underline{\quad}$$

$$8 = \underline{\quad} + \underline{\quad}$$

$$12 = \underline{\quad} + \underline{\quad}$$

$$16 = \underline{\quad} + \underline{\quad}$$

$$20 = \underline{\quad} + \underline{\quad}$$

Now we are warmed up. Fill in the blanks for each problem below. You must include a double.

$$5 = 2 + \underline{\quad} + \underline{\quad}$$

$$9 = 4 + \underline{\quad} + \underline{\quad}$$

$$17 = 8 + \underline{\quad} + \underline{\quad}$$

$$3 = 1 + \underline{\quad} + \underline{\quad}$$

$$7 = 3 + \underline{\quad} + \underline{\quad}$$

$$11 = 5 + \underline{\quad} + \underline{\quad}$$

$$15 = 1 + \underline{\quad} + \underline{\quad}$$

$$19 = 3 + \underline{\quad} + \underline{\quad}$$

$$19 = 1 + \underline{\quad} + \underline{\quad}$$

Now let's find 10's inside these problems to find the sums. Fill in the missing number and remember, you must make a 10.

---

$$12 = \underline{\quad} + \underline{\quad}$$

$$14 = \underline{\quad} + \underline{\quad}$$

$$13 = \underline{\quad} + \underline{\quad}$$

$$8 + 8 + 2 = 10 + \underline{\quad}$$

$$5 + 5 + 8 = 10 + \underline{\quad}$$

$$4 + 4 + 6 = 10 + \underline{\quad}$$

$$13 + 3 = \underline{\quad} + \underline{\quad} + \underline{\quad}$$

$$14 + 4 = \underline{\quad} + \underline{\quad} + \underline{\quad}$$

- Count the number of correctly completed problems. Write this number on the Progress Monitoring Chart.
- Allow the child to select a small reward from the treasure chest for beating his or her last best score.

# Use of Goals and Rewards

---

# Use Games to Build Fluency!

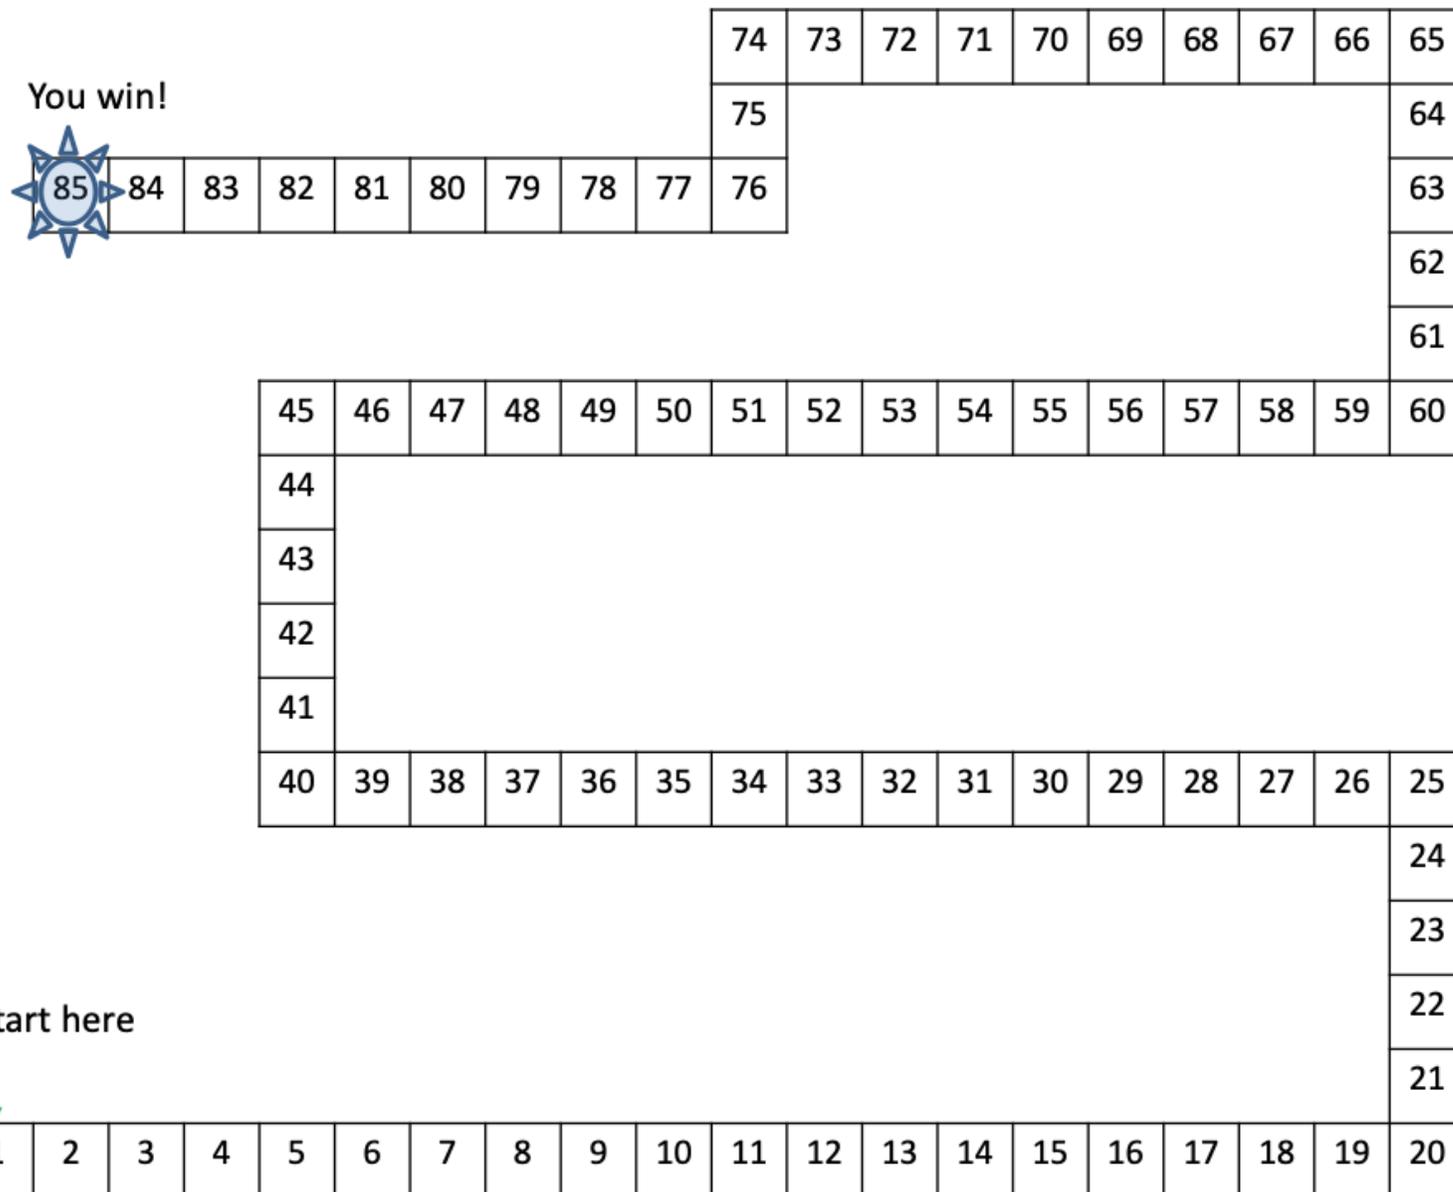

**Play War:** Make a stack of cards with 20 randomly selected numbers between 20 and 99 (2 of each) and play “war.” Each player turns over a card and the player with the higher-value number wins both cards. If the values are tied, then each player places three cards face-down and turns over the fourth card. The player with the higher value card takes all the cards. The object of the game is to win all the cards.

**Play 3-in-a-row bingo:** Here is another game that can be played as a single player or with multiple players. Each player needs a number grid (see below). Using the day's practice problems and answer key (don't show the student the answer key), just call out a problem and the student will try to answer verbally and make an X over the number on their grid. The object is to get three in a row in any direction to win the game. If needed, the student can write the problem to solve it. If the student makes an error solving the problem, then the he or she may not place an X on the grid for that turn.

1	2	3	4	5	6	7	8	9	10	11	12	13	14
15	16	17	18	19	20	21	22	23	24	25	26	27	28
29	30	31	32	33	34	35	36	37	38	39	40	41	42
43	44	45	46	47	48	49	50	51	52	53	54	55	56
57	58	59	60	61	62	63	64	65	66	67	68	69	70
71	72	73	74	75	76	77	78	79	80	81	82	83	84
85	86	87	88	89	90	91	92	93	94	95	96	97	98
99	100	101	102	103	104	105	106	107	108	109	110	111	112
113	114	115	116	117	118	119	120	121	122	123	124	125	126
127	128	129	130	131	132	133	134	135	136	137	138	139	140
141	142	143	144	145	146	147	148	149	150	151	152	153	154
155	156	157	158	159	160	161	162	163	164	165	166	167	168
169	170	171	172	173	174	175	176	177	178	179	180	181	182
183	184	185	186	187	188	189	190	191	192	193	194	195	196

**Play Add & Take ten:** Make a stack of 8 cards. Write, Add 10, Add 20, Add 30, Add 40 on the first four cards. Then write Add 10, Add 20, Add 30, Add 40 on the next four cards. Shuffle the cards. If you are playing single player, then pull a card and have the student start moving on the path to get to the winning space. If you draw a take card early in the game and there are not enough spaces to go back, just return to the start position of 1. This game is fun to play with two players. If you play with two players, print two copies of the board and take turns drawing cards to see who can get to the winning position first.

# Translate Verbal Expressions into Math Equations

## Matching Game

**Directions:** This game can be played with 2-4 players. Each of the numerical expression cards below has a matching verbal expression card. To play the game:

- Cut out the cards below.
- Shuffle all the numerical and verbal expression cards together.
- Deal each player a hand of 7 cards.
- When it is their turn the player draws one card.
- If the player has two cards that match (numerical and verbal expressions) they place the pair face up on the table.
- The first player to lay down all of their cards wins the game.

6 greater than a number is twice the number.

---

$$x + 6 = 2x$$

# Tactics to Look for

---

Use manipulatives with K & 1

---

Use expanded notation

---

Convert to equivalent quantities

---

Solve for missing value/unknown

---

Graphics- number lines, area models, graphs

---

Find & Fix problems

---

True or False. Change to make true.

---

Solve word problems.

---

Solve a more challenging problem type.

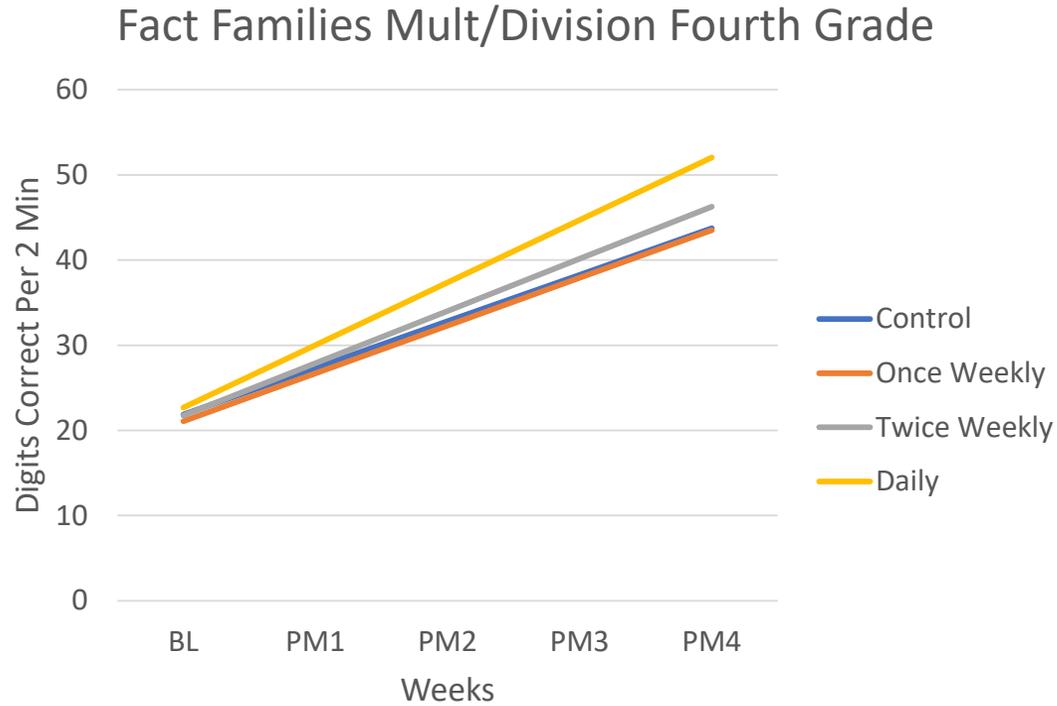

---

Games for fluency building.

---

Emphasis on High-Quality  
Implementation

Not doing the intervention.

Make intervention use fail-proof: Make sure you have materials. Make sure you know HOW to implement. Make sure there is a scheduled time for intervention.

Students do not know how to follow the classwide intervention routine.

Re-train the students. Show the students how to get into working pairs, how to use the materials, how to provide high-quality feedback, and how to be engaged.

Teacher is not completing all steps of the intervention.

Review missed steps and understand rationale. Papers must be scored during the intervention because that provides feedback to the student, provides the error correction opportunity, and provides goal attainment opportunity. The error correction component is important because it improves student accuracy for the next session.

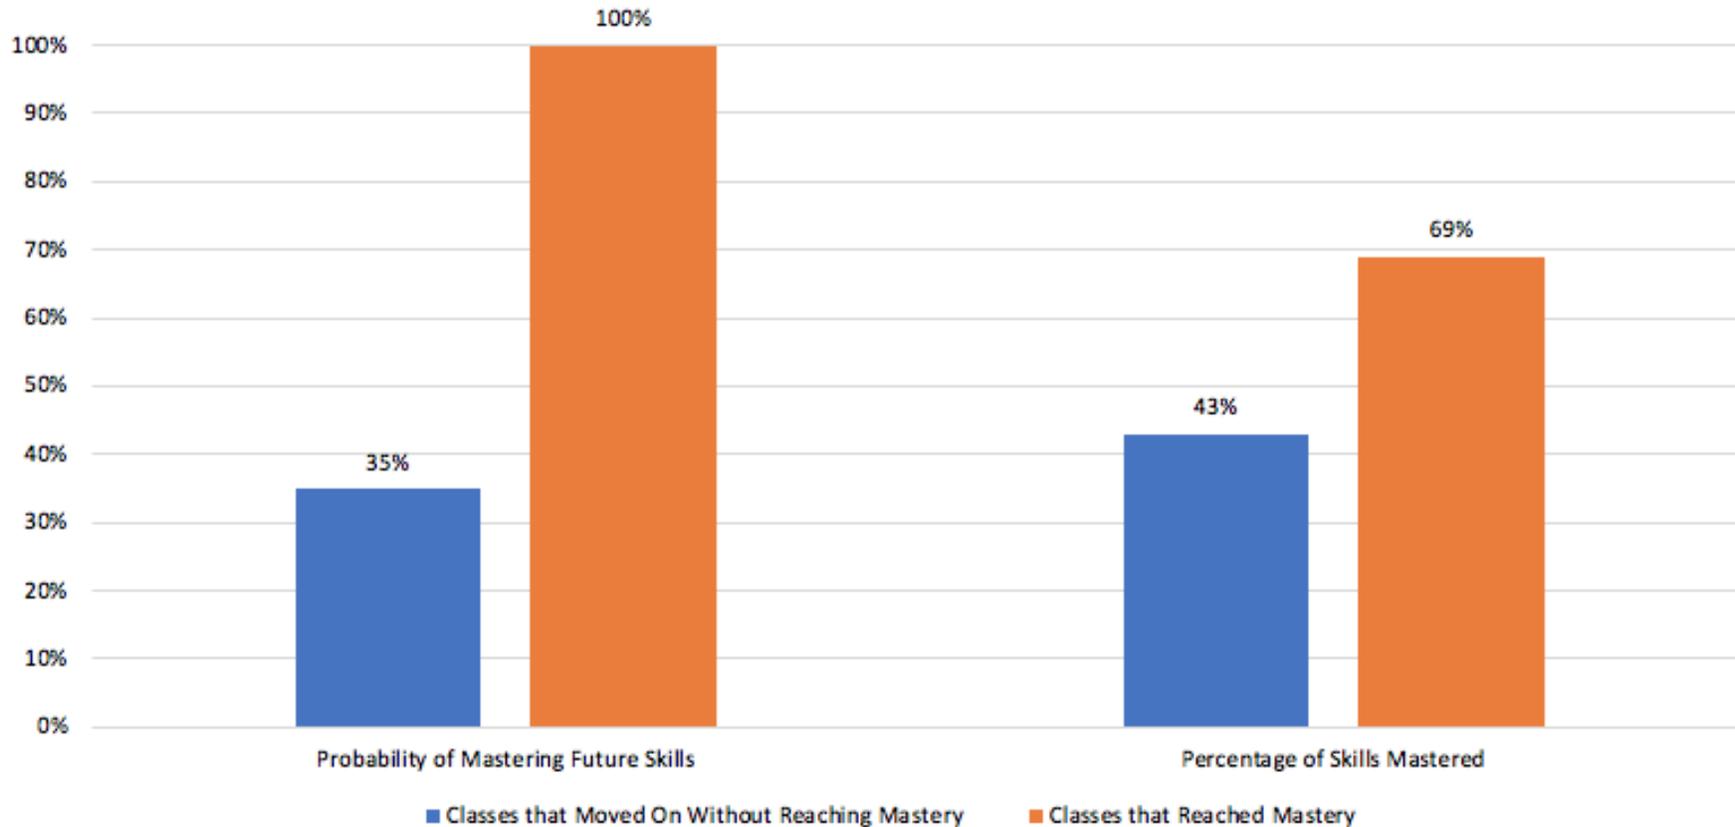

Children seem bored with the intervention.

Include rewards to motivate students. Display the median graph on dashboard for the class to see their growth. Be sure to set daily goals with the students!

# Even Veteran Districts will Drift

My students can't meet the mastery criterion, can we just move on?

Importance of Reaching Mastery for Each Skill During Classwide Intervention

# What Must Leaders Know?

- What actions are underway?
- What are the results right now?
- Where is support needed?
- Are proximal indicators headed in the right direction?
- What are the barriers we can troubleshoot?

## 1st Grade

Student Groups
View Groups

### Summary Notes for 1st Grade

- [Group 01#1 \(CourseId-SectionId\)](#): Progress is fantastic. This class is progressing at 1.9 weeks per skill. We'd recommend asking this teacher what's working and if they have any tips for others!
- [Group 01#1 \(CourseId-SectionId\)](#): This class has been on one skill for over 4 weeks. It might be worth checking in with them.
- [Group 01#1 \(CourseId-SectionId\)](#): This class has low intervention consistency. This means scores aren't being entered in Spring Math each week. We would recommend checking with them to make sure the scores can be entered.
- [Group 01#2 \(CourseId-SectionId\)](#): Progress is fantastic. This class is progressing at 1.8 weeks per skill. We'd recommend asking this teacher what's working and if they have any tips for others!

# Most Typical Intervention “Fixes”

- ✓ Watch the intervention session.
- ✓ Pay attention to dosage.
- ✓ Tighten up rewards.
- ✓ Make sure error correction occurs with high quality everyday.
- ✓ If students are making errors, use pre-teach protocol in support.
- ✓ Integrate review of prerequisite skills and current skills into games and practice opportunities during the school day.
- ✓ Know that some skills take TIME!
